BUSINESS REQUIREMENT

UBER RIDE ANALYTICS

Dashboard 1: Overview Analysis

This project analyzes Uber trip data to evaluate revenue trends, trip demand patterns, driver performance, and cancellation rates. It identifies peak high-revenue locations, and operational efficiency insights using SQL and visualizes key KPIs in Power BI. The goal is to support data-driven decisions for improving revenue and service performance.

KPI's

1. **Total Bookings** - How Many trips were Booked over a period of time?
2. **Total Booking Value** – What is the Total Revenue generated from all Bookings?
3. **Average Booking Value** – What is the Average Revenue Per Booking?
4. **Total Trip Distance** – What is the Total Distance Covered by all Trips?
5. **Average Trip Distance** – How far are customers travelling on a Average per Trip.
6. **Average Trip Time** – What is the Average Duration of Trips?

Donut Chart's

Create a Donut Chart to show following Values.

- Total Bookings
- Total Booking Values
- Total Trip Distance

Then, use a Measure to Dynamically Update the Visualizations based on User Selection.

By Payment Type (Card, Cash, Wallet etc.)

By Trip Type (Day/Night)

Additional Enhancements:

- **Dynamic Title –** Update the Chart title based on the selected Measures.
- **Slicers –** Add filters for Date, City and other interactives filters for deeper analysis.
- **Tooltips –** Show Additional details like Average Booking Value or Trip Distance.

Vehicle Type Analysis – Grid View In Power BI

Create a grid table to analyse key performance indicators like Total Bookings, Total Booking Value, Average Booking Value, Total Trip Distance across different Vehicle Types in Uber trips.

Power BI Implementation:

- **Use a Table or Matrix Visual** to display Vehicle Type with the KPIs.
- **Apply Conditional Formatting** to highlight high and low values.
- **Enable Sorting & Filtering** for user interaction.

Total Bookings by Day

- Detecting trends and fluctuations in daily trip volumes.
- Identifying peak and off-peak booking days.

Total Bookings by Location (Top 5)

- Identify the **top 5 locations** with the highest trip bookings.

Most Preferred Vehicle for Location Pickup

- Determine the most frequently booked **vehicle type** at each pickup location.

DASHBOARD 2: DETAILS TAB

The **Details Tab** provides a granular view of individual trip records, including pickup and drop locations, trip distance, duration, fare amount, payment type, driver details, and trip status. It enables drill-down analysis to investigate specific transactions, validate KPI calculations, and identify patterns or anomalies at the trip level.

Features of the Grid Tab

1. Grid Table with Key Fields:

- Displays essential trip-level details such as Trip ID, Pickup & Drop Time, Locations, Distance, Fare Amount, Payment Type, Driver ID, and Trip Status.
- Provides a structured tabular view for clear and organized data analysis.

2. Drill-Through Functionality:

- Users can right-click on a data point from other visuals (e.g., revenue charts, demand analysis visuals, heatmaps) and drill through to this Grid Tab.
- Displays detailed trip records related to the selected data point.

3. Bookmark for Full Data View:

- Includes a **"View Full Data" bookmark** to toggle between filtered drill-through results and the complete dataset.
- Allows users to quickly reset filters and view all records without manual clearing.
- Enhances report interactivity and user experience.

4. Sorting & Filtering Capabilities:

- Supports column-level sorting and filtering for precise analysis.
- Helps identify anomalies, high-value trips, or unusual patterns.

5. Data Validation Layer:

- Acts as a verification layer to cross-check KPIs and aggregated metrics shown in summary dashboards.
